ISOKOLINK RWANDA

Mobile Application Overview and Usability

1. Introduction

ISOKOLINK RWANDA is a digital marketplace designed to connect farmers, agricultural product sellers, and buyers across Rwanda. It helps sellers reach more customers and enables buyers to find agricultural products, compare prices, and contact sellers easily. The system aims to improve market access and reduce losses caused by agricultural products remaining unsold.

2. Simple and User-Friendly Mobile Application

The ISOKOLINK RWANDA mobile application is designed to be simple, clear, and accessible to different types of users, including farmers with limited digital skills. It should have an easy-to-understand interface, simple navigation, readable text, and clear buttons. Users should be able to browse products, check prices, view quantities and locations, and contact sellers with only a few steps.

The application should support both Android and iOS devices, making it accessible to more people. Its design should focus on usability, responsiveness, performance, and compatibility with different screen sizes.

3. Main Mobile Application Features

- **Buyer:** Browse approved products, search for items, compare prices, and contact sellers.
- **Seller:** Create product listings, upload photos, set prices and quantities, provide locations, and manage product availability.
- **Admin:** Review submitted products, approve or reject listings, and manage users and marketplace activities.
- **Easy Navigation:** Provide a simple dashboard and clear menus for all user roles.
- **Shared System:** Connect the mobile application to the existing backend and database so that website and mobile users access the same information.

Products should only become visible to buyers after administrator approval.

4. Continuous Improvement

ISOKOLINK RWANDA is still being developed, and we will continue improving it to make it more useful, reliable, secure, and accessible. Future improvements should focus on user

feedback, faster loading, easier product management, better communication between buyers and sellers, and improved performance on mobile devices.

Our goal is to build a mobile application that people can use confidently, regardless of their level of digital experience, while making it easier for agricultural sellers and buyers to connect.

Conclusion

ISOKOLINK RWANDA aims to provide a simple and accessible mobile marketplace that brings agricultural products closer to buyers. By continuously developing and improving the mobile application, we can make the platform more user-friendly, effective, and valuable to communities across Rwanda.
